Plasters, paints and special coatings for exterior applications

The perfect finish: Competence in colour

A systematic approach to colour design.

The complete programme

In addition to developing durable natural facade paints and specialised crack addressment coatings for refurbishing buildings, the Sto programme also includes self-cleaning silicone mineral resin coatings and specialised interior paints. The finely matched components of the Sto silicone resin system provide facades with lasting protection from the weather. In contrast to many competitors, Sto offers “genuine silicone resin paints and plasters”. The microporous structure of these products renders them extremely water-repellent, in conjunction with high water vapour and carbon dioxide permeability. Similarly to silicate paints, they are suitable for coatings on older substrates such as may be encountered when renovating historical buildings. The programme is rounded off by a range of interior coatings and Mediterranean fine renders.

The well-aimed use of colour in a manner which complements the architecture is subject to specific laws. The StoColor System provides a clear framework and a systematic approach to colour design based on subtly nuanced colour concepts of high aesthetic appeal.

The StoColor System

Is a structured system offering great variety in a unique planning instrument for the use of colour. A total of 800 different colours establish a sound foundation for creative and pioneering colour concepts. The StoColor System eschews colorimetric logic in favour of human perception of colour. It is based primarily on the colours yellow, orange, red, violet, blue and green. These six sections

are then mixed to form the 24 basic tones which correspond to the 24-part colour wheel. Each basic tone is assigned five colour rows which embody the principle of the same-colour triangle. This guarantees the StoColor System's high degree of functionality – designed in line with the aesthetic colour requirements in construction.

Aesthetic appeal and protection.

Value-maintaining coatings require a professional approach and high-quality specialised products in today's environment. The dual function of aesthetic appeal and protection is crucially important. Exterior paints from Sto guarantee an exceptionally high standard of quality in both areas.

StoSilco Color G

European manufactured and certified, self-cleaning mineral silicone resin paint with a breathable structure in a full range of colours.

StoColor Maxicryl

European manufactured and certified, hard, durable, matt, acrylic facade paint for a natural look. Available in a full range of colours.

StoLastic Color

European manufactured and certified, elastic, durable, dirt resistant and vapour permeable satin matt facade paint for added durability. Available in a full range of colours.

StoPur WV200 Transparent & Color

European manufactured and certified, two-component, matt urethane for coating interior and exterior surfaces.
